

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

This work is published at the suggestion of W. T. Harris, LL.D., Commissioner of Education, who said of it at the recent Pedagogical Conference, at the Johns Hopkins University:

"The idea of 'apperception' is the most important fruit thus far developed by the study of the psychology of pedagogics. R. H. Quick, the eminent English authority, refers in the highest terms to a short monograph on pedagogics which he has recently discovered, entitled *A Pot of Green Feathers*."

PREFACE

As the title of this paper seems a little strange a few words are necessary to explain its meaning. Some years ago I was listening to an object lesson given to a class of very young children by a pupil teacher who chose for her subject a pot of beautiful fresh green ferns. She began by holding up the plant before the class and asking whether any child could say what it was. At first no child answered, but presently a little girl said, "It is a pot of green feathers." Thereupon the teacher turned to me and said, "Poor little thing! She knows no better."

But I fell a thinking on the matter. Did the child really suppose that the ferns were feathers? Or did she rather use the name of a familiar thing to describe what she knew to be different, and yet noticed to be in some respects like?

This train of thought led me to put together what I knew of perception; and the following is the result of my labors. The principal authority which I have closely followed is Dr. Karl Lange's "Apperzeption," but I have derived much help from Herbart's "Psychology," Bernhard Perez's "First Three Years of Childhood," Romane's "Mental Evolution in Man," and the lectures of the late Professor T. H. Green.

THE POT OF GREEN FEATHERS

What do we know of the outer world? Of that which is not self? Of objects? How do we know *anything* of the outer world? We receive impressions from it; a table feels hard, a book looks brown in color, oblong in shape, and we say it is thick or thin. Are we simply receivers of these impressions,—hard, brown, oblong? Are our minds inactive in the process of getting to know these impressions? Or are they active? Are lumps of the outside somehow forced in upon our minds entire, without corresponding action on the mind's part?

No! our minds are not passive, the opposite is true. Through the senses the mind receives impressions, but these contributions from the senses would not be objects of knowledge, would not be interpreted, would not be recognized unless the mind itself worked upon them and assimilated them converting the unknown

stimulus from without into a sensation which we can hold in our thoughts and compare with other sensations within us. The mind converts the unknown stimulus from without into the known sensation. The outer world then is no more wholly the outer world when you know it. In our knowledge of the outer world there is always something contributed by the mind itself.

The truth that the mind adds to and changes the impressions which it receives through the senses is illustrated by the very different conceptions which exactly the same landscape gives rise to in different people. The geologist can tell you of the strata, the botanist of the vegetation, the landscape painter of the light and shade, the various coloring, and the grouping of the objects; and yet, perhaps, no one of them notices exactly what the others notice. A plank of wood, again, seems a simple object, and able to tell one tale to all, but how much it tells to a joiner, concerning which it is dumb to a casual observer.

Or again, visit as a grown man the school

room or playground where you played as a child, especially if you have not visited the scene in the interval. How changed all seems! The rooms that used to look so large have become dwarfed. The tremendous long throw which you used to make with a ball from one end of the playground to the other, to what a narrow distance it has shrunk! Yet the room and the ground are what they were. It is your mind that has changed. The change in your mind has brought about for you a change in the thing.

Two people, then, or even oneself at different times of one's life may perceive the same object without obtaining the same perception. Yet if the external object stamped itself on the mind as a seal or die stamps itself on wax, if the mind were as passive as wax, how could one object give rise to such different impressions? The difference must be due to the mind.

Neither is it difficult to understand that this is so if we think what is the nature of the process by which the mind interprets the impressions which it receives from outward objects. When the mind receives an

impression it refers it to a previously received impression that happens to resemble it. Thus every new impression is interpreted by means of old ones, and consequently every new perception is affected, colored as it were, by the already acquired contents of the mind, and nothing can be known or recognized at all until reference and comparison have been made to previous perception. My object here, is to make this point, *perception*, which I admit is not easy, as clear as I can make it.

Perception of an object is not so simple a matter as at first it seems to be. "Oh," some one will say, "simple enough! a dog runs by me: through my senses I receive sensations of the animal, and I know that I see a dog." But this is no perfect account, for suppose two strange animals, say, a *Tasmanian Devil* and an *Ornithorhynchus* came up the street together, my senses will make me aware of their presence, but if I had not learned anything about them previously, I shall not know, I do not say merely their names, but even their exact shape and distinguishing marks. I shall say, "What in the name of wonder are

they?" After a little looking at the strange pair I should probably say, "One is a kind of bear and the other is a kind of duck—a funny bear and a funny duck."

Observe how the process of interpretation of my impressions goes on. Looking at the Tasmanian Devil, my impressions divide themselves into two classes, one set of impressions resembling impressions of bears which I have previously received, while the other set finds nothing already existing in the mind to which it can attach itself. A kind of fight goes on between new and old. In the end the points of resemblance overpower the points of dissimilarity, and I judge the one animal (the T. D.), in spite of much unlikeness, to be a kind of bear,—in doing which I am wrong, as it is a kind of marsupial; and in judging, by a similar process, the *Ornithorynchus* to be a sort of bird because of its bill, the mind equally makes a mistake, or, as we say, receives a wrong impression.

There are then at least two parts in the process of knowing any object. First of all there is the excitation of our nerves, the nervous stimulus which makes us feel that

we have a feeling, but does not explain what the feeling is; and secondly there is the interpretation of the feeling by a mental action through which the undetermined and as yet unknown sensations or gifts of the senses are referred to known impressions and explained.

It is about this act of mental assimilation of the impressions which we receive from external objects that I am treating to-day. I am not dealing with the question of the origin of our impressions or the physiological basis of them, but with the growth of knowledge in the understanding by the working of the mind upon impressions. I think that modern psychologists have carried the analysis of this process sufficiently far for the results of their studies to be of practical value to teachers and parents. If we have to teach, is it not useful to know how the mind acquires knowledge?

Take an object and set it before a child—say a fern. If the child has never seen a fern before, he knows not what it is. Impressions of it, he receives, but he cannot interpret them adequately. The bot-

anist looks at the same fern and not only sees and knows that it is a fern but also what kind it is, how it is distinguished from other ferns, where it grows, how it may be cultivated, and all about it. The difference between the knowledge which the sight of the fern gives to the child and that which it gives to the botanist does not depend upon the fern, but upon the state of mind of the two observers. The mind adds infinitely more to the impression received when it is the botanist's mind which receives it, than when it is the comparatively empty and uninformed mind of the child. What you can know of an object depends upon what you already know both of it and of other things. Philosophers and poets like Kingsley, Carlisle, Herder, Goethe, as well as educationists and psychologists, impress upon us this truth: "In regarding an object we can see only what we have been trained to see."*

*CARLISLE.—We can see only what we have been trained to see,

GOETHE.—We hear only what we know.

HERDER.—What we are not we can neither know nor feel.

Impressions, then, have to be *interpreted* before they are clear to us. What is the easiest case of our interpreting impressions? Perhaps some such as the following. I see a man a little way off and say to myself, "Here comes my brother." I have so often recognized my brother that the whole process of recognition goes on in my mind without any check or hindrance. The existing mental conception of my brother masters completely and promptly the fresh impressions which his present appearance makes upon me. The identification of the new and the old is uninterrupted, prompt, and immediate. The same speed and accuracy of interpretation is observable in his prompt and correct recognition by a good reader of the words and sentences in his book.

Now take an opposite case, when it is hard instead of easy to interpret impressions. Suppose that we see something

ROUSSEAU.—We can neither know, nor touch, nor see, except as we have learned.

In other words the present impression produces only such an effect on the mind as the past history of the mind renders possible.

which is quite new to us. Suppose that the new impressions do not connect themselves with any previously assimilated impressions, and that try as we may to refer them to something known all is in vain. Then we feel puzzled; a hindrance, or a check, or obstruction occurs in our minds. If the impression be very strong it may cause us to 'lose our heads,' as we say, or it may even overwhelm us.

It is narrated that one of the natives of the interior of Africa who was accompanying Livingston to Europe no sooner found himself on the great Indian Ocean with nothing but heaving waters far and near in his view, than he became overpowered by the immense impression which the new experience made upon his mind, and flung himself overboard into the waves, never to rise again. Similarly at the Paris Exhibition, every evening when the gun was fired at the Eiffel Tower for the last time at ten o'clock it was not unusual to see a sort of frenzy among the visitors. Under the already strong impression produced by the electric illuminations, the luminous fountains, and the varied magnificence

Process of Assimilation

of the great show, some people seemed to be seized with a veritable panic. Cries of admiration escape from some, and of terror from others, followed by fainting, attacks of hysteria, and prostration.

Similar shocks occasionally prove fatal. Only in September last a little girl, four years old, was standing on the platform, near Sittingbourne, with her parents, who were on their way to Kent for the hop-picking season, when an express train dashed through the station. The little one was terror-stricken, and on the journey down screamed every time an engine came within sight or hearing. She dropped dead. The doctor ascribed death to the shock.

To assimilate then a wholly new impression is necessarily a task of some difficulty, but the results are luckily not always so sensational as those which I have just described, and the following is an account of what more usually takes place.

If the new impression is not of a nature to make us feel strongly, and if it is isolated and unconnected with any other knowledge present to our minds, it proba-

bly passes away quickly and sinks into oblivion, just as a little child may take notice of a shooting star on a summer night, and after wondering for a moment thinks of it no more; if, however, our feelings are excited, and if the object which gives the impression remains before us long enough to make the impression strong, then the impression becomes associated with the feelings and the will comes into play, in consequence of which we determine to remember the new impression, and to seek an explanation of it. With this object the mind searches its previous stock of ideas more particularly, comparing the new with the old, rejecting the totally unlike and retaining the like or most like, and in the end it overcomes the obstacle of assimilation and finds a place for the new along with the old mental stores, thereby enriching itself, consciously or unconsciously—unconsciously in earlier years, and consciously afterwards.

As an instance, I will suppose a child who has seen only blue violets finds a white one. Of his impressions of the white flower, some are new and some are

old. The greater part are old and lead him to infer that he sees a violet, but the impression of whiteness is new and leads him to say, "This is not a violet." Let us represent the characteristics by which he recognizes a blue violet by the letters A B C D, the D standing for the color blue and A B C for all the rest of the flower. When now he finds a white violet he again notes A B C as before, but instead of D, the color blue, he receives the impression E, the color white. Had the color been the same, the impression of the flower would have coincided with previous impressions of violets, but the difference between D and E causes an obstruction or hindrance to this inference. The mind is not at ease with itself; the agreement of new and old only reaches a certain way. The old mental image and the newly acquired one don't exactly tally.

What happens? In the two mental images now present and side by side in the mind, the new and the old (the new being more vivid, the old being more firmly established), the like elements, namely A B C, strengthen each other and unite to

make a clear image, while the unlike elements D and E, the blue and the white, obstruct each other, become dim and at last obscured. The like elements in the end overcome the obstruction caused by the unlike and beat them out of the field of mental vision, so that the two partly resembling impressions become blended or fused, as by mental smelting, into one. The two are recognized as one by the mind. The old appropriates or assimilates the new. The child finds an old *Expression* for the new *Impression*, and says to itself, "There is a violet."

Of course an impression need not belong to only one previously acquired impression or group of impressions; it may be connected with other groups. In this case it will be recalled to consciousness on more frequent occasions than if it belonged to one other mental state only. Hence a new impression, *if you give it time*, may find for itself many more points of attachment with previous impressions and ideas than it found just at first.

For instance, I may visit the Amiens Cathedral. Presently when I have ad-

mired the building I recall to mind various historic events that took place at the capital of Picardy. I remember that Julius Cæsar started thence to conquer Britain, that Peter the Hermit was born there, and that not far off Edward III. won the battle of Crecy, and that its name often comes up in the long hundred years war. I think of the Peace of Amiens in 1802, the visit of Buonaparte to Amiens when he prepared to invade England, and lastly of the German army in 1870. One impression calls up another, and the whole mass together strengthen and confirm and amplify the original impression. Isolated, these separate events are of less interest than when grouped together with my actual inspection of the ancient building.

A wise man, therefore (if I may draw a passing moral), does not, if he can help it, decide or act in a hurry, under the influence of new impressions, but he will give them time to find points of connections with old impressions. What may to-day seem irreconcilable with truth, or honor, or happiness, may prove when time has been allowed for assimilation inconsistent

neither with sincerity, nor good name, nor good fortune.

Educationists, like Mr. Arnold, also, will continue to implore the public to simplify the studies of children, being convinced that unless the mind has leisure to work by itself on the stuff or matter which is prescribed to it by the teacher, the thinking faculty on which all progress depends will be paralyzed and dead knowledge will be a substitute for living. The mind will have no power of expanding from within, for it will become a passive recipient of knowledge, only able to discharge again what has been stuffed into it, and quite powerless to make fresh combinations and discoveries. Cram is the rapid acquisition of a great deal of knowledge. Learning so acquired, though useful for a barrister, has less educational value than the public believe, for it does not promote but rather tends to destroy the active and constructive powers of the mind.

When the mind has much difficulty to overcome in assimilating a new impression, and hence has to spend time in so doing, it is benefitted by the process; for

in the first place the necessity of care, caution, accurate observation, and much rummaging (if I may venture on the expression) among the ideas of the mind tends to sharpen the senses, the sight, the touch, the hearing, and the rest, by making them sensitive to fine shades which might otherwise escape us; and in the second to amplify and enlarge meagre impressions.

The eye, by itself, for example, only reveals to us surfaces. How then do we seem to see solid bodies? A baby stretches out its hand for the moon: how is it that what seems so near to him looks so far off from us? Because in our case the impressions conveyed by the eye are supplemented by the impressions received through the touch, and the two distinct sets of impressions combined together in the mind furnish us with the conception of a third dimension, besides length and breadth — viz., depth. The child who has not yet got so far as to have sufficiently often united the impressions derived from looking, with those derived from touching and moving, cannot rightly interpret the impressions which he

receives. The moon seems quite close to him.

Impressions on the other hand which pass easily into their place in the mind do not always tend to clearness of ideas. People may look at an object hundreds of times for a special purpose, and beyond serving that purpose get no permanent impressions at all. Many people who look at a clock or watch many times a day cannot at once, when asked, draw from memory a dial with the hours correctly placed upon it.

The process of assimilation may even mislead, just as familiarity with an object may hinder accurate observation. Goethe says there is a moment in his life when a young man can see no blemish in the lady he loves, and no fault in the author he admires. A man in love may think that his Angelina sings divinely sweet, though her voice is like a crow's. He interprets the impressions which he receives according to previously formed impressions.

This leads us to see that it is not right to say, as we sometimes do say, "My

senses play me false." The senses do not lie. The ear does not in the instance in question convey sweet sounds. The sense of hearing does not judge at all. The ear conveys the sound truly enough. The judgment concerning the sound is made in the mind of the listener. The judgment it is which is falsified by prejudice, the lover being naturally prepossessed in favor of his mistress.

So the wanderer in the grave yard by night in the uncertain light of the misty moon judges a tall grave-stone to be a 'sheeted ghost.' His eye is not at fault. His judgment is. He receives the impression from the object truly, but he refers his impression to the wrong group or store of previous knowledge. He should refer it to optical phenomena, diffraction of light and the rest. He actually does think of pictures and stories of vague appearances of human shapes without human substance, and all the superstitious imaginings of poor frail human nature. His senses are not under control of his reason.

We have seen then how each impression that we receive from external objects is

consciously or unconsciously interpreted and made known to us by a kind of internal classification through which its resemblance connects it. We have now to see that in this process of interpretation of a new impression by that which is old, the previously existing mass of knowledge which interprets the new is itself modified and made clearer.

Suppose a child lives in the flat of the fen near Cambridge, and that by going to the Gogmagog Hills he learns to form an idea of what a hill is. Then suppose him to be transported to Birmingham, where he goes out to the Lickey Hills. These he will recognize as hills by aid of the previous conception of a hill which he has formed in his mind, but at the same time he enlarges his ideas of a hill; and if he travels further west and climbs the Malvern Hills and the Welch Hills he will still further amplify his conception. Now let him study the elements of geology and physical geography, and learn to trace the connection between the shape of hills and the rock or soil composing them, together with the action of wind and water,

heat and frost, and the word hills will still have yet an extended meaning.

Every time you refer an object to a class, as when you say, "Yonder mass—it may be Ingleborough—is a hill," you not only explain the thing about which you are talking (Ingleboro'), but you also add to your idea of the *class* to which you refer it (hill). The new thing is explained by old or already existing ideas, but for the service which the old does the new in thus interpreting it, the old idea receives payment or recompense in being made itself more clear.

Suppose you have a dozen pictures: apes, bears, foxes, lions, tigers, etc. Then every time you show one of these to a child, and the child learns to say "That tiger is an animal," "That lion is an animal," he not only learns something about the tiger, the lion, and the rest, but also extends his conception of what an animal is. Hence we can see when it is that learning a name is instructive: it is when the name is a record of something actually witnessed. If, however, you tell a child who does not know what a ship is, or what

wind is, or what the sea is, that a sail is the canvas on which the wind blows to move the ship across the sea, the names are only names and do not add to his knowledge of objects.

So far we have chiefly considered the case where impressions from the outside world or from *outward objects* are being interpreted by the mind, as the case of violets, the pot of ferns, and the like; but a similar process goes on wholly in the mind between ideas which exist there after external objects have been removed. Consider how weak fugitive impressions may be strengthened and held fast by this process. Alongside the feeble, and therefore fugitive, impression arises a mass of previously acquired and nearly connected impressions and ideas, dominating the former, and by means of connections with other stores of knowledge setting up a movement in the mind which lights up the obscure impression, defines (it and fixes) in the mind in-
✓✓✓

For example, I find a little white flower on the top of Great Whernside, *Rubus Chamæmorus*. I might notice it for a mo-

ment and pass on oblivious. Suppose, however, that it occurs to me next day to think of the so-called zones of vegetation, and how the Pennine Hills were covered with the ice sheet as Greenland now is, and how England then had an arctic flora, and how it may be that this flower, which in England ~~only~~ grows 2,000 feet above the sea, being killed by the warmth of lower levels, may perhaps be a botanical relic of that surprising geological epoch: and then what interest attaches to that flower. Why the very spot on which it stands seems stamped in the mind indelibly.

Nothing new then can be a subject of knowledge until it is associated not merely mechanically (as a passing breeze with the story which I read under a tree) but by a psychological process with something in the mind which is already stored up there, the new seeking among the old for something resembling itself, and not allowing the mind peace until such has been found, or until the new impression has passed out of consciousness.

This process of interpreting impressions and ideas by reference to previous impressions and ideas must not be confounded with the reference of such interpreted impressions to self. When you refer this process to self, when you recognize your self as going through the process, and as being the subject of the assimilating process, this is self-observation. You may have this self-consciousness either along with the interpreting process, or after it, or not at all. Dogs, parrots, and many animals, clearly interpret impressions and objects as one of a class, as a kitten did which, after eating a piece of raw meat, afterwards chewed a ball of red blotting paper, inferring it to be meat from its color; but they do not do this with recognition of self as the subject of the process. Children do not appear to be conscious in their thoughts and actions much before they are three years old, and their minds seem at first much to resemble the minds of animals.

We may now further apply this principle of the growth of the mind to practical work in the class room.

When something new presents itself to us, it does not as a rule, except when it affects the emotions in some way, arrest our attention, unless it is connected with something already known by us.

A young child visited the British Museum, and was next day asked what he had noticed. He remarked upon the enormous size of the door mats. Most other impressions were fugitive, being isolated in his mind. The mats he knew about, because he compared them with the door mat at home. Among all the birds, the only one he remembered was the hen, and passing by the bears and tigers with indifference he was pleased to recognize a stuffed specimen of the domestic cat. The child only remembered what he was already familiar with, for the many impressions from other objects neutralized each other and passed into oblivion.

One great art in teaching is the art of finding links and connections between isolated facts, and of making the child see that what seems quite new is an extension of what is already in his mind. Few people would long remember the name and

date of a single Chinese king picked by chance from a list extending back thousands of years. Facts of English history are not much easier to remember than this for children who are not gifted with strong mechanical memories. Hence the value of presenting names, dates and events, in connection with external memorials, such as monuments, buildings, battlefields, or with poems and current events, and the like. Story, object, and poem, illustrate and strengthen each other. It ought not to be hard to teach English history in the town of York, where there is a continuous series of objects illustrating the course of affairs from pre-historic times to the present date. Our object in teaching should be to present facts in organic relation to each other, instead of getting them learnt by heart as a list of disconnected names.

If, then, all the growth of the mind takes place from earliest to latest years through the apprehension of new knowledge by old, then the first business of the young child in the world is to learn to interpret rightly the impressions that he receives

from objects. [To receive and master the gifts of his senses is his first duty.]

But this task cannot in the early stages be fulfilled in a strictly systematic way. You cannot present all the world piecemeal to the child, object after object in strictly logical order. One educationist objected to little children visiting a wood or forest because the different sorts of trees were all jumbled together instead of being scientifically classed and arranged as they would be in a botanical garden. The child, however, must take the world as he finds it. Impressions come crowding in upon him in such numbers that he has no time at first for paying minute attention to any one. In truth so massed and grouped are his impressions, that one may almost say that the outer world presents itself to him as a whole—of course an obscure, unanalyzed whole,—and that it is a matter of difficulty to isolate one perception clearly from its concomitant perceptions.

The whole must be analyzed into parts bit by bit. Out of the mass of obscure and ill-defined impressions, educationists

should study which are they which stand out and arrest attention most readily, and in what order they do this. We do not find that those impressions are most striking which are logically the most important, but rather those to which the practical needs of daily life give prominence—food, clothing, parents, brothers, sisters, other children and their experiences. Such are the things that children are most taken up with. But each impression once grasped is the basis or starting point for understanding another, and thus the manifold variety of objects is simplified and brought within the compass of memory by a sort of unconscious reasoning.

A child, for instance, who kept a chicken, but never saw chicken at table, being limited in its meat-diet to beef, when at last the chicken came to table roasted, called it "hen-beef," clearly interpreting by an elementary process of reasoning the new by the old. Take a child to a wild beast show and observe how he names the animals by aid of a very general resemblance to those he may previously know. The elephant is a donkey

because he has four legs; the otter is a fish; and so on. These comparisons are not jests, nor even mere play of fancy, but the result of an effort of an inexperienced mind to assimilate new impressions. The child is only following the mental process which we all have to follow in becoming masters of our impressions and extending our knowledge. Clearly the limited stock of ideas of the child renders it easier for him to make mistakes than for us to do so, but in some matters it is well to remember that we are no further advanced than children, and consequently often behave as such.

A little French child, a year old, who had travelled much, named an engine *Fafer* (its way of saying *Chemin de fer*); afterward it named steamboat, coffee-pot and spirit lamp, anything in short that hissed and smoked, "*fafer*"—the obvious points of resemblance spontaneously fusing together in the child's mind and becoming classified not quite incorrectly. Another child who learnt to call a star by its right name applied star as a name to candle, gas, and other bright objects,

clearly interpreting the new by the old, by use of an unconscious elementary classification or reasoning.

Thus we see the value and helpfulness of language, in the process of acquiring and interpreting impressions. Having once separated out from the indistinct masses of impressions borne in upon him from the outside world some one distinct impression, and having marked that impression with a name, the child is thenceforth readily able to recognize the same impression, in this instance that of brightness, when mixed up with quite other masses of impressions, and to fix its attention on that one alone.

Thus the word helps the mind to grow and expand. The use of the word is a real help to the knowledge of things. The name when learnt in connection with the observation and handling of an object is not merely a name, a barren symbol for nothing signified, but is a means for acquiring fresh knowledge as occasion serves. A name thus learnt (*i. e.*, in presence of the object) when applied by the learner to a new impression exactly resembling

the former is really an expression of and an addition to the mental stores. It is then as the filling in of a sketch or as the further completion of an unfinished circle.

How different is such naming from learning by heart of names of objects without handling the things signified. How often have text-books of science, geography, and history been prescribed to be got up for examination, and how often have the results been disappointing. The student thus taught sees only the difference of a letter in the alphabet between Carbonic Acid and Carbolic Acid, JACOBINE, and JACOBITE, and a mere transposition of a figure in expressing an incline as 8 inches in 1 mile, instead of 1 inch in 8 miles. The words call up no mental image. The figure 8 is a symbol only, as it does not call up the image of 8 things.

A name given in the presence of the object serves afterwards to recall the image or picture of that object; and it does this the more perfectly, the more accurately the object is studied in the first instance. Children for want of language signify many of their impressions by ges-

tures before they can describe them in words; and *gesture* language, especially if encouraged, precedes spoken language, besides accompanying it. Children are imitative; they love to act over again what they have seen, especially when much impressed; as in George Elliott's pathetic description of the baby-boy attending his mother's funeral in puzzled wonder, and thinking how "he would play at this with his sister when he got home." With children, this "acting," or "playing" at being, more resembles talking over, giving expression to and describing what has been seen, noted, and assimilated, than aimless exercise of the muscles and the intelligence.

How profoundly right, therefore, Froebel was in making so much of action-songs in his Kindergarten, and how excellent his games are, in which every action of the child corresponds to some observed impressions with which the child is familiar. Froebel's actions correspond to realities, and are not mere physical movements. They are forms of expression of things. They correspond to facts,

some powerful influence, as in the case of St. Paul, we call it a conversion.

Well, then, it may be said, in these cases your position is given up. The new should be regarded as the means by which the old is known, instead of the old as interpreting the new. But this is not the case; for however overpowering the new conception may be for a time yet in the end the whole store of knowledge in the mind proves too strong for it, overpowers it, and finds some place for it, after which the mind is at peace with itself, and appears to have been enlarged and not diminished or divided by the fresh experience, however strange and unusual it may have been.

I have shown, then, that when the child called a pot of ferns a pot of green feathers he was by no means using a name without attaching any meaning to it, and that he should have been encouraged for a praiseworthy effort to explain what he saw.

It is, however, the business of parents and teacher to help the child to learn exactly what it is that he names. A child, for instance, saw a duck on the water, and was taught to call it "Quack." But the

child included in this name the water as well as the duck and then applied it to all birds on the one hand and all liquids on the other, calling a French coin with the eagle on it a "Quack," and also a bottle of French wine "Quack." Such a mistake in naming is to be guarded against as obviously tending to confusion of thought. The poet Schiller as a child lived by the Necker, and called all rivers which he saw "Necker." Such an error is less serious as it is easily put right. If the child notes its impressions and refers them intelligently to previous impressions as best it can, then it is not important if he is not quite correct about names.

We—teachers and parents—may take a hint from this, and be more ready to give class-names to begin with, leaving details to come later. Teach the child in front of a picture of a herring, or better, pictures of herring, sole and pike, "That is a fish" first of all, and only afterwards "That fish is a herring." For teaching general names, such as bird, beast, fish, and reptile, in presence of pictures of eagle, cow, herring, and adder, has a two-fold use. The class-

name (fish, beast, &c.) thus given (1) directs the child's attention to a few points among many, and those easy to grasp, and hence is a guide to the child's mental powers, which are apt to be overwhelmed by the number of individual impressions of things, all disconnected and isolated, much in the same way as in an intricate country full of cross roads your way is made easy if you are told to ignore all other tracks and follow the road bordered by telegraph posts; and (2) it enables the child to understand the usual conversation of its elders and the words and language in books.

Grown-up people use general terms in daily conversation which children only slowly acquire without help from teachers. Many of these simpler class names are easily taught and are a pleasure to the children to learn, for they answer to the early stages of elementary reasoning. Country children often have a small vocabulary of general terms compared with town children, and less understand the language of books; but on the other hand from exercising their senses on objects and being brought into close contact with

out-of-door work they often have a greater real power of observing and interpreting things outside themselves and greater originality in this respect than town children who are sharper in talk and society. However, both kinds, the knowledge of language and the mastery of objects, should be taught together, for both are indispensable in life.

Young children are perhaps quicker than older people to note superficial resemblance of things. Because, no doubt, they have fewer old impressions stored in the mind wherewith to compare new impressions, and comparison among a few things is more rapidly and expeditiously made. They have to pay for this advantage, however, because they are liable to misinterpret impressions—to call a pot of ferns a pot of feathers, to refer impressions to the wrong group in their mind, groups with which they are accidentally and not logically connected.

What is more, objects are not so clearly distinguished—set over against each other with children as with grown people. Children hardly distinguish themselves

into soul and body. They know of their undivided personality—body, mind, and soul—that it moves, feels happy, sad, hungry, &c., and they attribute the same feelings to all other things. Birds, beasts, and inanimate objects are like affected as themselves. "Jack the dog is thirsty," "Poll is angry," "Kitty is sleepy," "The stars blink," "The engine goes to bed," "The knife is naughty to cut me." They do not distinguish between figures of speech or metaphors and realities. Their minds move in a region of twilight in which the real and unreal, the true additions to knowledge, the actual gifts of the senses are confused and blurred and altered by the additions which the mind itself makes to them, and they cannot separate the one from the other.

To this stage of mental progress how appropriate are fables, allegories, fairy stories, parables, and the like. If anyone thinks that it would be better if the child's mind could move only in the sphere of the exact I would reply, (1) that this does not seem to be nature's process; (2) that looking to the mode of growth of the mind it

Function of the Imagination

does not seem even possible; (3) that if you try to keep the child's mind to exactness you may clip and pluck the wings of imagination.

Now without imagination there is little advance in knowledge, little discovery in the sphere of science; and in the sphere of morality, without some imagination you are quite unable to put yourself in the place of another, which is the basis of sympathy and mental support, and the foundation of the social fabric. The mere sight of a neighbor's joy or sorrow does not awaken sympathy.

Three little children were thrown out of a train in an accident, and one was frightfully mangled to death, but the other two, who were unhurt, and could not realize what had happened, stooped down and went on plucking daisies with unconcern. In the case of young children you can hardly go too far in the way of associating new learning with personal feeling, even at the expense of exactness; and the infant-school teacher who, in a lesson on the Sun, instead of dwelling on its roundness, brightness, and heat, began

by calling it a lamp in the sky, lighted in the morning and put out at night; lighted for men to go about their work, and put out for them to go to sleep, showed a true knowledge of the key that opens the door into the child's mind.

This information is not exact, but inasmuch as it is based on what children understand and like to hear about, it finds a ready entrance into their minds. But it is clear that what is to the child its natural mode of expression is arrived at by the teacher only through imagination, and hence arises the teacher's difficulty. It is a useful hint to study the children's own lead and follow it. School necessarily limits the child's life. You cannot bring all creation into the four walls of the class-room. But what you lose in extent you gain in depth: you lose variety, you gain in concentration. Before school-time, all things engage the child's attention in turns, and nothing long. At school he has to attend to a few things, and to keep his attention fixed upon them for short periods at first, but for increasingly longer ones. It is a matter of practice

and experience to find out what things most readily arrest attention, and in what way information can best be conveyed so as to arrest attention, and it is in these matters that the skill of the teacher comes in.

I am not sure that if the teacher's art is to be summed up briefly it may not be described as the art of developing the power of fixing attention.

For instance, when we present a picture or even an object to a child, neither object nor (still less) picture explains itself. The object needs to be pointed out piecemeal, and all its parts called attention to separately; for the child only sees it as a whole about which it can say but little and soon tires of. The picture but very partially represents the objects which the artist depicts, much being suggested and left to the imagination of the beholder. Even when we say we actually see an object we forget how much of what we think we see is really inference from some small part of what we see, and nothing is more deceptive than merely ocular evidence. Thus pictures of things which the chil-

dren have seen are much better, and the former should serve as a preparation for the latter.

But even pictures will only go a certain way in making known to us things past and things remote, facts of history and geography. The greater part of advanced instruction must be conveyed by words. Is it an historical scene we are treating of? The child and many grown people interpret all by their own experience; towns and houses in history resemble in his mind those with which he is familiar; men and women move about in the dresses of his neighbors; their aspect and language are in his mind the same as those of his people with whom he daily converses. Such inaccuracies may be partly conceived. Hence Gœthe says "The past is a book with seven seals."

The best plan is to read the past with one eye on the present. Look at the pictures of the Holy Family as drawn by Italian and Dutch painters. The chief fact which they intend to depict is not obscured but made clearer by the painter having made the homely surroundings

French and Italian rather than original. In History and Geography, in order to help the child to understand old times and realize what distant lands are, we must store his mind with conceptions based upon frequent observations of present time and of his own home and its surroundings.

How far such observations may carry the student in interpreting the unseen, is proved by the beauty and correctness of the descriptions of Alpine Countries which were written by Schiller before he had seen the Alps. In history the most human part of the narrative takes the firmest hold of the mind, and the story of King Alfred and the Cakes, though not a very notable historical anecdote, serves at least to fix the name of the king in the child's mind, who would not so easily remember the peace of Wedmore. Eating he knows more about than making treaties.

We may now trace the process of acquiring knowledge in its more advanced stage. The child has now learnt that a pot of ferns is not a pot of feathers. Perhaps, however, he has only seen one kind of fern—

say a Lady Fern. After a few weeks he may see another—perhaps Maiden Hair. The points of resemblance between the two make him say "That is a fern": the points of difference hinder the process of assimilation and make him doubt; in the end the mass of old impressions resembling each other overpower impressions which differ, and he says "This is a fern," and in so doing he enlarges his conception of what a fern is.

Let us now suppose that he comes across a good teacher who shows him many kinds of ferns, and points out the difference between ferns and flowering plants and mosses. Every fresh distinction, every observation of a new fern helps to modify his previous knowledge. Old and new impressions react on each other.

But now mark how essentially the same and yet how different are the two mental states, the earlier one, namely, when the child, I would say the child's mind, recognizes of its own accord the second plant as a fern by means of its previous acquaintance with another fern, judging from a more or less superficial resemblance; and

the later state of mind when he has learnt all the scientific distinctions by which a fern is classified in a different class from flowering plants and mosses. We have now passed from Infant School learning to the instruction which is appropriate to the Upper School and the advanced classes. The child has outgrown a state in which the mind reasons unconsciously, and has arrived at a state in which reasoning is conscious; he has left behind a condition or stage of development in which he was at the mercy of his impressions, and has progressed to a state of mind in which he can compare, check, and control his impressions. He has passed from a state in which he unconsciously accepted what was present to his mind, to a state in which he can infer, judge and criticise.

The pot of ferns is now seen to have more points in which it is unlike feathers than points in which it resembles them. Of the many impressions derived from looking at the pot of ferns, the feather-like impression which at first stands out from the rest and forces itself on the mind, to the exclusion of the other impressions

which would, if attended to, modify the judgment, is now by means of conscious reasoning brought under proper control, and put in a subordinate position. What appeared to be a fact is now seen to be a fancy, and after all a fancy which expresses some element of truth—viz., the resemblance between ferns and feathers.

These considerations, perhaps, throw some light upon Dr. Allbutt's warning to parents about the dreams and illusions of children. The fancies of childhood, he thinks, are sometimes the ante-chamber of insanity in adults. I do not think he intended to knock on the head many poetic and popular conceptions about children's pretty fancies, as was stated in some evening review of his remarks.* It is clear,

*CHILDHOOD'S DREAMS: IMAGINATION OR INSANITY?

In the course of the meeting of the Medico-Psychological Association held at York last night, Dr. Clifford Allbutt (of Leeds) read a paper on the "Insanity of Children," which, if its statements be well-founded, knocks on the head many poetic and popular conceptions. Wordsworth speaks of a child's idea being a reminiscence of "the fairy palace whence he comes." Dr. Allbutt sees in them

Imagination vs. Insanity

however, that the crude method of assimilating knowledge, which is natural and apparently inevitable in a child, ought by degrees to yield to more accurate conceptions under the influence of wise instructions.

It is one thing to confuse ideas unconsciously; it is another thing to do so consciously. The child makes an unconscious mistake in calling ferns feathers, but if

only a step toward the insane asylum. Most people regard it as a healthy sign if the children have pretty fancies, and those are thought to be happiest who keep their illusions longest. But Dr. Allbutt would reverse this judgment. The fairy dreams of childhood are only the result of defective organization, and healthy growth consists in their evaporation. Here are some of the chief passages of Dr. Allbutt's paper:—The imagination of children was the vestibule of the insanity of adults; in children they saw in simple primary forms that with which they were familiar in the more complex and derivative forms of insanity in adults. If a man lived in a vain show, far more so did the child; if a man's mind was but a phantom in relation to the world, so fantastic was the child's mind in relation to that of the man. Fantastic—that was the key to the childish mind. In him was no definite boundry between the real and the unreal. Day-dreams which in an

this confusion is cherished by the child after he well knows the real distinction between the two, and if he acquires or cultivates a habit of mind in which reality is made to give way to make-believe and pretense, the child may lose control over this judgment and become in the end imbecile. The best antidote to foolish imaginings appears to me to be the time-honored fables of Æsop, the sacred parables and allegories, and the best modern fancies

adult would be absurd, were to a child the only realities. As the child grew older, and the sense-impressions organized themselves more definitely and submitted to comparison, phantasy became make-believe, and the child slipped backwards and forwards between unconscious, semi-conscious and conscious self-deception. Pretty were the fancies of a child, yet the healthy growth of the child consisted in their evaporation. But if the growth of the mind were something other than healthy, then these fancies kept their empire; they did not attenuate, and the child did not put off its visions. They were not likely to forget that the persistence of insanity in children might prevent the due advance of the organization of the results of impressions, and might ultimately, as the adolescence approached, leave the sufferer in a state of more or less imbecility.—*Pall Mall Gazette*.

for children, like those of Andersen or Ruskin. Fantastic the child will be; it is our business to make his fancy healthy.

The object then, of learning in education is not only to make the mind fuller and to enrich the understanding, but if the instruction be of the right kind the additional knowledge ought to make the knowledge more exact and better defined. The method of acquiring the extended knowledge, also, ought to have even more far-reaching results than information itself. Accustomed to right methods of study the child will learn to be cautious in dealing with fresh impressions; to feel the pleasure of receiving new impressions and the need of care in referring them to their proper class; to realise the danger to which everyone is liable of forming hasty judgments, and to weigh evidence for and against a provisional judgment.

In short, study ought at least to make the student acquainted with the limits of knowledge in general, and the limitations of *his* knowledge in particular. The country proverb, "He does not know a hawk from a heronshaw," illustrates the sort of

progress that learning should produce in a child. He must acquire at school the power of apprehending quickly and correctly. He must become sharp in receiving impressions, and accurate in referring them to the class to which, not fancy, but reasoned judgment, leads him to refer them.

Accurate and complete conceptions, true, logical definitions in *all* matters that we deal with in daily life, cannot be obtained by any of us. We can only keep the ideal of perfect knowledge before our eyes as a guide to us in the path of right knowledge. The educational value of the acquisition of knowledge is to improve the natural powers of thought and judgment, and to enable the learner to deal with the masses of observed facts which press more and more heavily on us as we have to move amid the complications of mature life. In acquiring knowledge the mind is naturally active, and not merely passive. The active element is most precious, and modern education often tends to strangle it. Yet instruction which does not add increased energy to the thinking powers

is failing its purpose. Learning cannot be free from drudgery, and a great deal of the process of teaching and learning—say what you will—must be a tax on patience and endurance; neither can we entirely dispense with the mere mechanical exercise of the memory; but if the method pursued is correct, the drudgery ends in an increase of the energy of the mind, and a desire and a power to advance to new knowledge and discovery.

You cannot undertake at school to fit every child for entering a trade, or craft, or profession, without further learning; but what he has learnt as a child ought to develop his constructive faculties, and to enable him to deal effectively with the matter which he will have to handle in the stern school of life; and if, in addition to this, he has acquired an ingrained preference for the good before the bad, the true before the false, the beautiful before the foul, and what is of God before what is of the Devil, his education has been as complete as it admits of being made.

As in the early stages of life, so in the later, our knowledge and our conduct de-

pend as much on what is within us as to what is without. The work of life cannot be well done mechanically; in this everyone must be partly original and constructive, for the world is not merely what we find it, but partly what we make it, and what Coleridge has finely said of Nature applies to all we think and do.

O Lady, we receive but what we give,
And in our life alone does nature live;
Ours is her wedding garment, ours her shroud!
And would we ought behold of higher worth
Than that inanimate cold world allowed
To the poor, loveless, ever-anxious crowd?
Ah! from the soul itself must issue forth
A light, a glory, a fair luminous cloud
Enveloping the earth.

That education is the best, not which imparts the greatest amount of knowledge, but which develops the greatest amount of mental force.

ADVERTISEMENTS.

Biographies of Noted Educators.

1. *Pestalozzi: his Aim and Work.* By Baron DE GUIMPS. Translated by Margaret Cuthbertson Crombie. Cloth, 12mo, pp. 336, \$1.50.

"A teacher knowing nothing of Pestalozzi would be like the lawyer that has never heard of Blackstone. We commend this book strongly as specially adapted to younger students of pedagogy."—*Ohio Ed' Monthly*, June, 1889.

"To those who seek to know how one of the world's greatest reformers planned and executed his work, how this and that grand principle was wrought out, how truth was dissociated from error, this volume will be a delightful treasure. And there are many such who are not content to know the name and nothing more, but seek to understand the man and the motive. To such this book is indispensable."—*Educational Courant*, July, 1889.

2. *Autobiography of Friedrich Froebel.* Translated and annotated by EMILIE MICHAELIS and H. KEATLEY MOORE. Cloth, 12mo, pp. 183, \$1.50.

"He writes so simply and confidentially that no one can fail to understand everything in this new translation. It would be of great benefit to American youth for fathers and mothers to read this book for themselves, instead of leaving it entirely to professional teachers."—*New York Herald*, Aug. 4, 1889.

3. *A Memoir of Roger Ascham*, by SAMUEL JOHNSON, LL.D.; and Selections from the *Life of Thomas Arnold*, by Dean STANLEY. Edited, with Introductions and Notes by JAMES S. CARLISLE. Cloth, 16mo, pp. 252, \$1.00.

Besides the biography of Ascham in full this volume contains selections from "The Scholemaster," with fac-simile of the ancient title-page. From Stanley's "Life of Arnold" those chapters have been taken which refer to his work as a teacher, and are published without change. Thus the book gives in small compass and at a low price all that is most important in the lives of these two great teachers.

4. *John Amos Comenius, Bishop of the Moravians; his Life and Educational Works.* Cloth, 12mo, pp. 229, \$1.00.

Our recent republication of his famous *Orbis Pictus* has added interest to the life of the famous reformer.

5. *Essays on Educational Reformers.* By R. H. QUICK. Cloth, 16mo, pp. 331, \$1.50.

Much the best edition of this famous work, which its vivacious style makes the most interesting of educational histories.

6. *Pedagogical Biography.* A series of reprints from Quick's "Educational Reformers," giving the most important sketches separately, in pamphlet form, at a uniform price of 15 cts. each. There are 7 numbers, as follows:

- | | |
|--|-----------------------------|
| I. The Jesuits, Ascham, Montaigne, Ratich, Milton. | |

The Cyclopedia of Education.

This largest and handsomest of our publications is an octavo volume of 562 pages, price \$3.75. How indispensable it is to the teacher and to the school library may be judged from the following testimonials.

"It is admirable in every way. The book is worthy of a lower shelf in every teacher's library."—*Educational News*, June 8, 1889.

"This handsomely printed book is worth adding to the pedagogical shelf of any reference library."—*The Critic*, March 23, 1889.

"An elegant volume, which will find a place in the library of every teacher. The bibliography at the end of the book is the best educational check-list in the country."—*R. Heber Holbrook*, in *Normal Exponent*, May, '89.

"It is the most ambitious work of the kind yet published in English, and is, therefore, a very valuable volume for the teacher's library. Moreover, its value is increased greatly by the addition of a very extensive Bibliography of Pedagogy, both English and foreign."—*Pop'r Educator*, Mch. '89.

"This work occupies a distinct and peculiar field, and will be of continual value to the educator. The special aim of the editor, Mr. A. Fletcher, has been to give a clear but concise account of facts and questions belonging to educational topics. Here are a few titles which will give some idea of the scope of the work: Pestalozzi, Attendance, Analysis of Sentences, Chemistry, Technical Education, Precocity, Pedagogy, Hamiltonian Method, Hegel, Universal Language, Utilitarianism, University, Kindergarten. Under these, and many scores of other topics, there is given a mass of carefully combined information, much of which could not be found elsewhere."—*Christian Union*, Feb. 22, 1889.

"A handbook of ready reference on educational subjects of a high plane of scholarship has long been a desideratum in this country, and this work in a large measure supplies this want. It is a handbook of reference on all subjects of education—its history, theory, and practice. The list of contributors to the work embraces the leading educational writers of England, including such names as Oscar Browning, J. S. Curwen, Sir Philip Magnus, Arthur Sidgwick, and James Sully. These men are writers of the broadest scholarship, capable of thinking deeply on educational subjects, and what they have to say is entitled to the highest confidence of the educational world. The object diligently kept in view by the writers of this work has been to make it useful to all who take an interest in educational questions, and especially to those engaged in teaching. With this purpose in view the object has been to present a practical view of educational facts and questions discussed. An exhaustive treatment of the great variety of subjects has not been aimed at, the end sought being to bring their pedagogic features into clear outline. Not the least useful part of the work is a 'Select and Systematic Bibliography of Pedagogy,' occupying some forty pages. The work makes a large octavo volume of 562 pages. The mechanical execution is unusually satisfactory."—*Journal of Pedagogy*, June, 1889.

1 C. W. BARDEEN, Publisher, Syracuse, N. Y.

School Issues of the Day.

1. *Denominational Schools*. Discussion at the National Association, 1889, by CARDINAL GIBBONS, BISHOP KEANE, EDWIN D. MEADE, and JOHN JAY. Pp. 71. 25 cts.

2. *The Educational Value of Manual Training*, by WM. T. HARRIS, LL.D., Commissioner of Education. Pp. 14. 15 cts.

3. *Art Education the True Industrial Education*, by WM. T. HARRIS, LL.D. Pp. 9. 15 cts.

4. *Methods of Instruction and Courses of Study in Normal Schools*, by THOMAS J. GRAY, LL.D., President Colorado State Normal School. Pp. 19. 15 cts.

5. *Pedagogical Chairs in Colleges and Universities*, by B. A. HINSDALE, Ph.D., Professor of Pedagogy in the University of Michigan. Pp. 11. 15 cts.

6. *Opportunities of the Rural Poor for Higher Education*, by Prof. JAMES H. CANFIELD, University of Kansas. Pp. 24. 15 cts.

7. *Honorary Degrees as Conferred in American Colleges*, by Prof. CHAS. FOSTER SMITH, Ph.D., Vanderbilt University. Pp. 9. 15 cts.

8. *The Present Status of the Township System*, by C. W. BARDEEN, Editor of the *School Bulletin*. With an appendix containing the Compulsory Law as introduced into the New York Legislature of 1890. Pp. 60. 40 cts.

9. *Effect of the College-Preparatory High School upon Attendance and Scholarship in the Lower Grades*, by C. W. BARDEEN. Pp. 5. 15 cts.

10. "Organization" and "System" vs. Originality and Individuality in the Teacher, by HENRY SABIN, State Superintendent of Public Instruction, Iowa, with opening of the discussion by C. W. BARDEEN. Pp. 9. 15 cts.

11. *Examinations as Tests for Promotion*, by WM. H. MAXWELL, Ph.D., Superintendent of Schools, Brooklyn, N. Y. Pp. 11. 15 cts.

12. *Compulsory Laws and their Enforcement*, by OSCAR R. COOPER, State Superintendent of Public Instruction, Texas. Pp. 6. 15 cts.

13. *University and School Extension*, by WM. T. HARRIS, LL.D. Pp. 12. 15 cts.

14. *The General Government and Public Education throughout the Country*, by WM. T. HARRIS, LL.D. Pp. 8. 15 cts.

15. *Report on Pedagogical and Psychological Observation*, by WM. T. HARRIS, LL.D. Pp. 6. 15 cts.

 The 15 Numbers will be sent to any address on receipt of \$1.50, or bound in half leather for \$2.00.

Nos. 1 to 7 were read at the meeting of the National Association in 1889, and Nos. 9 to 15 at the meeting of the National Association in 1890. No. 8 was read at the meeting of School Commissioners and Superintendents in New York City, 1888.

C. W. BARDEEN, Publisher, Syracuse, N. Y.

Special Books for Regents' Schools.

1. *The Regents' Questions in Arithmetic, Geography, Grammar and Spelling* from the first examination in 1866 to June 1882. (No questions of later date will be printed.) Being the 11,000 Questions for the preliminary examinations for admission to the University of the State of New York, prepared by the Regents of the University, and participated in simultaneously by more than 250 academies, forming a basis for the distribution of more than a million of dollars. *Complete with Key.* Cloth, 16mo, pp. 473. \$2.00.

2. *Complete.* The same as above but without answers. Pp. 340. \$1.00.

3. *Separately.* The same, each subject by itself, all Manilla, 16mo.

Arithmetic, 1293 Questions, pp. 93, 25 cts. *Geography*, 1987 Questions, pp. 70, 25 cts. *Grammar*, 2976 Questions, pp. 109, 25 cts. *Spelling*, 4800 Words, pp. 61, 25 cts. *Keys to Arithmetic, Geography, and Grammar*, each 25 cts..

These are of course an indispensable preparation for the Regents' Examinations, and have been used for fifteen years in most of the Regents' schools.

4. *Regents' Selections in Literature.* Selections for Repetition from Memory at the Examinations conducted by the Regents of the University of the State of New York, in connection with the courses in American, German, and French Literature. Leatherette, 16mo, pp. 56. 25 cts.

These selections were officially prepared in the Regents' office, and published under the direction of Mr. James Russell Parsons, Jr. Besides their special purpose, they will be found admirable for use in all classes.

5. *Review Problems in Arithmetic* for Schools under the supervision of the Regents. By MRS. JENNIE B. PRENTICE. Paper, 16mo, pp. 96. 20 cts.

6. *Review Questions in Geography* for Schools under the supervision of the Regents. By MRS. JENNIE B. PRENTICE. Paper, 16mo, pp. 48. 15 cts.

These books have been prepared to supplement the published books of Regents' Questions, and afford an admirable drill in these subjects. Not a single problem in the first can be found in any published arithmetic, and very few questions in geography have ever been asked by the Regents that are not to be found in the second.

7. *Elementary English.* Prepared with reference to the Regents' Examinations in the State of New York. By JOHN D. WILSON. Leatherette, 16mo, pp. 50. 35 cts.

This contains among other things all the work in Etymology required by the last Regents' Syllabus.

8. *A Vocabulary of Caesar's Gallic War, Book II.* Cloth, 16mo, pp. 69. By GEORGE M. SMITH. Price 50 cts.

In the study of modern languages, even when carried on the countries where they are spoken, the author has found that substantial progress has been made only by committing to memory long lists of words. The attempt in this way to secure a thorough knowledge of Caesar's vocabulary has led to this little book.

5. *Conspiracy of the Helvetians.* Five chapters of Caesar's Gallic War. For use in First-Year Latin Classes, especially in Regents' Schools. Containing Special Vocabulary, Exercises in Latin Composition, Idioms, and Irregular Comparisons, with Suggestions for Study. By a High School Teacher. Leatherette, 16mo, pp. 50. Price 35 cts.

C. W. BARDEEN, Publisher, Syracuse, N. Y.

The School Bulletin

AND NEW YORK STATE EDUCATIONAL JOURNAL.

Established 1874. 16 Pages, 10x12. \$1.00 a Year.

The SCHOOL BULLETIN is one of the five oldest educational journals in America, and has been under the same editor and proprietor from the beginning. It is not filled with "methods" and other spoon-food for young teachers who want their ideas ready-made, but appeals to superintendents, principals, and assistant-teachers who regard their work as a vocation, and who want to look upon it broadly and comprehensively.

In the feature of educational news it has never had a rival. Its chronicles of what has happened in the schools of New York during the past seventeen years are unmatched in educational literature, and it has taken note of whatever has happened in other States that involved general principles.

The following are among recent expressions of opinion that the BULLETIN and its editor have elicited.

"I get a multitude of educational journals, but I read only three of them. One of them is the SCHOOL BULLETIN."—Hon. JOHN HANCOCK, *State Commissioner of Schools, Columbus, Ohio, February 20, 1890.*

"We have a great number of exchanges, but there are only three educational journals that I regularly read through, and one of them is the SCHOOL BULLETIN. When I read one of Mr. Bardeen's editorials I say to myself 'There is a man who knows what he is talking about.'"—GEORGE P. BROWN, *editor of The Public School Journal, February 20, 1890.*

"If the reader wants two spicy and sensible essays by the keenest educational writer of the day, he will find in the above what he wants."—*Intelligence, Chicago.*

"In sending my renewal of subscription to the BULLETIN, I desire to express the great pleasure which I have enjoyed in reading some recent articles from your pen, especially the review of Miss Willard's book, and the description of the recent meeting of the National Association. They both show your remarkable power of analysis and felicity of expression."—*Sup't JOHN H. CLARK, Flushing, N. Y. September 6, 1890.*

"Permit me to add a word of commendation and appreciation for the articles which have recently appeared in the BULLETIN over your name. Their worth is all the more noticeable when compared with the trash that appears in so many of our educational papers."—GEORGE G. RYAN, *principal high school, Leavenworth, Kansas, September 15, 1890.*

"Am delighted with your article on 'Homely Teachers.' It is not only bright, but beams with wisdom. It is the wisest of the wise things you have ever written. Please send me a dozen copies of the BULLETIN. I want the Oneonta pupils to stand high when examined under your form."—JAMES M. MILNE, Ph. D., *principal Oneonta Normal, and president of New York State Teachers' Ass'n, October 2, 1890.*

C. W. BARDEEN, Publisher, Syracuse, N. Y.

Books of Reference.

The distinctive feature of a scholar's library is the large proportion of its books of reference. Education does not fill up a man with information: it teaches him where to go for information when he wants it, and gives him the habit of going for it when he wants it. This requires that he have at hand the books he will most frequently refer to. After the dictionary, among those most important to the teacher are the following:

1. *The Cyclopædia of Education*. Cloth, 8vo, pp. 562, \$3.75.

This compares with other books on education as the dictionary compares with the spelling-book. The latter is useful, but the former is indispensable. In the latter you may find the word you want; in the former you are sure to. This is a day when teachers must be well informed. Here are some of the topics you may be asked questions about, or may want to inform yourself about: *Pestalozzi, Comenius, Object Teaching, Ascham, Froebel, Thomas Arnold, The Kindergarten, Horace Mann, School Management, Industrial Education, School Economy, German Schools, School Law, Sloyd, etc., etc.* You may be sure you can find all of these topics and scores more like them in this book. It is the Pedagogical Unabridged Dictionary, and every energetic teacher must have it.

2. *The Ready Reference Law Manual*. By E. E. KNOTT. Cloth, 8vo, pp. 381, \$3.00.

IT IS NOT MEANT FOR LAWYERS, but for those who are not lawyers. It gives clearly and simply the provisions of the law that concern every man, and of which it sometimes costs a man a good deal to be ignorant. Capitalists often make their sons regularly admitted lawyers, not with any view to practice, but that they may be able to protect the property they will inherit. Even the man of little property, or dependent on a salary from which he can not save much, should know the most important features of the law. The little needs protection even more than the much, for loss is more disastrous.

3. *Thesaurus of English Words and Phrases*. By PETER MARK ROGET. Cloth, 12mo, pp. 710, \$2.00.

For acquiring an extensive vocabulary that will enable one to use just the right word in the right place, this work has no equal. For illustration of its usefulness, see Bardeen's *Complete Rhetoric*, pp. 401-403.

4. *Verbal Pitfalls: a manual of 1500 words commonly Misused*. By C. W. BARDEEN. Cloth, 16mo, pp. 223. 75 cts.

"In these days of slang and careless speech there is great use for a book of this kind, and teachers should have a copy lying on their desk in the school-room, ready for constant reference. The writer for the press, public speakers, and all people generally will find this little manual exceedingly valuable."—*No. Carolina Teacher*.

"I am very much pleased with it, and shall have it at once placed on our library list and made one of the requisites for the teacher's desk."—*Supt. C. T. Meredith, Ventura Co., Cal.*

C. W. BARDEEN, Publisher, Syracuse, N. Y.

Descriptions of School Systems.

1. *Prussian Schools through American Eyes.* By JAMES RUSSELL PARSONS, JR. Cloth, 8vo, pp. 110. \$1.00.

The teacher who wishes to know exactly what the much-praised Prussian elementary schools do, and on what their excellence depends, will find it set forth here compactly and clearly. The New York reader will have the additional benefit of frequent comparisons between Prussian educational details and those of his own country.—*Educational Review*, June, 1891.

In short this small volume is the most complete and satisfactory account of Prussian elementary education now accessible to American teachers, and ought to be carefully studied.—*Wis. Jour. of Edu.*, June, 1891.

It is scant praise to say that it is the best account ever written of what Prussian schools are and what they are doing, and it is certain to be the authority for many years to come.—*Educational Courant*, May, 1891.

The Report deals only with elementary education, and is of special worth because of the particularity with which he describes the system in use. The rigid and uniform practice in Prussia makes this possible, since the observer is not bothered by too much freedom of exercise on the part of the teacher. Seeing one school he sees all.—*Atlantic Monthly*, Aug. 1891.

2. *The Free School System of the United States.* By FRANCIS ADAMS. 8vo, pp. 301. \$3.75.

We bought the entire remainder of the edition of this book, recognized as the most complete and thoughtful description ever written. Only a few copies remain.

3. *Roderick Hume; the Story of a New York Teacher.* By C. W. BARDEEN. Cloth, 16mo, pp. 295. \$1.25.

This describes graphically the schools of New York in 1874, including the management of union schools, academies, Regents' examinations, employment of teachers, election of boards of education, trickery of book-agents, etc. While occasionally humorous, the story is after all a straightforward depiction of things just as they were in New York in 1874. *The Nation*, comparing it with *Locke Amuden*, says, "The book is vivacious, and the author knows the ground he describes." The veteran A. J. Rickoff says, "I can certify that it is true to life." *Erziehungs Blätter* speaks of it thus: "It describes in quite a masterly way a few traits of the school system of the State of New York. Some scenes are drawn with wonderful truth from actual life, as e. g. the one in which a change of text-books is proposed. The author is certainly a shrewd psychologist."

4. *A Day in my Life; or Every day Experiences at Eton.* Cloth 16mo, pp. 184. Price \$1.00.

A capital description of just how boys really live in the great "public schools" of England.

C. W. BARDEEN, Publisher, Syracuse, N. Y.

Life and Works of Pestalozzi.

1. *Pestalozzi: his Aim and Work.* By BARON DE GUIMPS. Translated by Margaret Cuthbertson Crombie. Cloth, 12mo, pp. 336, \$1.50.

Demands a deep and earnest perusal.—*Teachers' Aid*, London, Feb. 2, 1889.

Among the best books that could be added to the teacher's library.—*Chautauquan*, Oct., 1889.

It is sufficient to say that the book affords the fullest material for a knowledge of the life of the great educational reformer.—*Literary World*, June 22, 1889.

Should be carefully studied by every teacher.—*The Pacific Educational Journal*, Aug., 1889.

The most satisfactory biography of Pestalozzi accessible to English readers.—*Wisconsin Journal of Education*, Aug., 1889.

There is not a teacher anywhere who cannot learn something by the perusal of this work.—*Science*, June 7, 1889.

The work is a timely reminder how far we have strayed in following the deity of "examination," which should have been kept in its place as the handmaid of education.—*The Schoolmaster*, London, Feb. 16, 1889.

2. *Pestalozzi and Pestalozzianism.* By R. H. QUICK. Paper, 16mo, pp. 40, 15 cts.

This is a reprint from Quick's *Educational Reformers*, and contains the best brief abstract that has ever been written.

3. *The Pestalozzian Series of Arithmetics.* Teachers' Manual and First-Year Text-Book for pupils in the first grade. Based upon Pestalozzi's method of teaching Elementary Number. By JAMES H. HOOSE. Boards, 16mo, 2 editions. *Pupil's Edition*, pp. 156, 35 cts. *Teacher's Edition*, containing the former, with additional matter, pp. 217, 50 cts.

This is a practical exposition of the *Pestalozzian Method*, and has met with great success not only in the Cortland Normal School, where it was first developed, but in many other leading schools, as at Gloversville, Babylon, etc. It is diametrically opposed to the Grubé Method, and good teachers should be familiar with both, that they may choose intelligently between them.

4. *Lessons in Number, as given in a Pestalozzian School, Cheam, Surrey.* The Master's Manual. By C. REINER. Cloth, 16mo, pp. 224. \$1.50.

5. *Lessons in Form, or, an Introduction to Geometry as given in a Pestalozzian School, Cheam, Surrey.* By C. REINER. Cloth, 16mo, pp. 215. \$1.50.

Both 4 and 5 in one volume, \$2.00.

These works were prepared in 1835 under the supervision of Dr. C. Mayo in the first English Pestalozzian school, and have particular value as representing directly the educational methods of the great reformer.

C. W. BARDEEN, Publisher, Syracuse, N. Y.

Froebel and the Kindergarten.

1. *Autobiography of Friedrich Froebel*. Translated and annotated by EMILY MICHAELIS and H. KEATLY MOORE. Cloth, 12mo, pp. 188. \$1.50.

Useful and interesting * * * among the best that could be added to the teacher's library.—*The Chautauquan*, Oct., 1889.

There is no better introduction to the Kindergarten.—*Wisconsin Journal of Education*, Sept., 1889.

It is a book which can be trusted to make its own way.—*The Independent*, Oct. 10, 1889.

These two books [Froebel and Pestalozzi] recently from the press of the enterprising and discriminating house of C. W. Bardeen, are the last and not the least important contribution to American pedagogical literature. The professional library is incomplete without them.—*Canada School Journal*, Sept., 1889.

2. *Child and Child-Nature*. Contributions to the understanding of Froebel's Educational Theories. By the Baroness MARENHOLZ-BUELOW. Cloth, 12mo, pp. 207. \$1.50.

It is a fit companion to the *Autobiography* and the two are published in the same style—a capital idea—and a royal pair of volumes they make.—*Educational Courant*, Oct., 1889.

Its design is to illustrate the theory and philosophy of Froebel's system. It does this so clearly and pleasingly as to give no excuse for criticism. * * * The volume is one profitable for every mother, as well as every teacher of children.—*Chicago Inter-ocean*, Sept. 14, 1889.

3. *The First Three Years of Childhood*. By B. PEREZ, with an Introduction by Prof. Sully. Cloth, 12mo, pp. 294. \$1.50.

The eminent English psychologist, Prof. Sully says that Perez combines in a very happy and unusual way the different qualifications of a good observer of Children, and that he has given us the fullest account yet published of the facts of child-life. * * * The typography of the work is excellent, and in external appearance the book is by far the handsomest American edition issued.—*Journal of Pedagogy*, April, 1889.

4. *The Kindergarten System*. Principles of Froebel's System, and their bearing on the Education of Women. Also Remarks on the Higher Education of Women. By EMILY SHIRREFF. Cloth, 12mo, pp. 200. \$1.00.

5. *Essays on the Kindergarten*. Being a selection of Lectures read before the London Froebel Society. Cloth, 12mo, pp. 175. \$1.00.

6. *Primary Helps*. A Kindergarten Manual for Public School Teachers. 8vo, boards, pp. 58, with 15 full page plates. 75 cts.

7. *The New Education*. Edited by W. N. HAILMANN. Vols. V and VI, the last published. Each 8vo, cloth, pp. 146. \$2.00.

8. *The New Education*. By Prof. J. M. D. MEIKELJOHN. Paper, 16mo, pp. 85. 15 cts.

G. W. BARDEEN, Publisher, Syracuse, N. Y.

The Five Great English Books.

The recognition of Teaching as a Science was much earlier in England than in this country, and the five books which are there recognized as standards, have probably no equals in soundness and scope. Hence they are usually the first books adopted by Reading Circles, and are indispensable to the library of an intelligent teacher. These are:

1. *Essays on Educational Reformers.* By ROBERT HENRY QUICK. Cloth, 16mo, pp. 330. Price \$1.50.

This is altogether the best *History of Education*. "With the suggestion that *study should be made interesting*," writes Principal Morgan, of the Rhode Island State Normal School, "we most heartily agree. How this may be done, the attentive reader will be helped in learning by the study of this admirable book."

2. *The First Three Years of Childhood.* By B. PEREZ. With an introduction by Prof. JAMES SULLY. Cloth, 12mo, pp. 294. Price \$1.50.

This is incomparably the best psychology for primary teachers, and forms the proper *Basis* for pedagogical knowledge. The *Journal of Pedagogy* says (April, 1899): "Some of the greatest questions relating to primary education can only be solved by an accurate observation and correct interpretation of the infant mind, and as the author of this volume combines the proper qualifications for the work with ample opportunity, his observations and deductions are entitled to the highest confidence."

3. *Lectures on the Science and Art of Education.* By JOSEPH PAYNE. Cloth, 16mo, pp. 384. Price, \$1.00.

The student is now ready to take up the *Science of Education*, which is nowhere else so brilliantly and effectively presented. The lectures are singularly fascinating, and the full analysis and indexes in this edition make it easy to collate and compare all that the author has uttered upon any topic suggested.

4. *The Philosophy of Education, or the Principles and Practice of Teaching.* By THOMAS TATE. Cloth, 16mo, pp. 440. Price \$1.50.

This gives the application of the Science to the Art of Teaching, and is without a rival in its clear presentation and abundant illustrations. The author is not content with giving directions. He shows by specimens of class-work just what may be done and should be done.

5. *Introductory Text-Book to School Education, Method and School Management.* By JOHN GILL. Cloth, 16mo, pp. 276. Price \$1.00.

This supplements the work of all the rest by practical directions as to *School Management*. Of the five this has had a sale equal to that of all the rest combined. The teacher's greatest difficulty, his surest discomfiture if he fails, is in the discipline and management of his school. That this manual has proved of inestimable help is proved by the fact that the present English edition is the 44th thousand printed.

C. W. BARDEEN, Publisher, Syracuse, N. Y.

Books for Young Teachers.

1. *Common School Law for Common School Teachers.* A digest of the provisions of statute and common law as to the relations of the Teacher to the Pupil, the Parent, and the District. With 500 references to legal decisions in 28 different States. 14th edition, wholly re-written, with references to the Code of 1888. By C. W. BARDEEN. 16mo, cloth, pp. 120. Price 75 cts.

The reason why the teacher should make this his first purchase is that without a knowledge of his duties and his rights under the law he may fail either in securing a school, in managing it, or in drawing the pay for his services. The statute provisions are remarkably simple and uniform. The decisions of the Courts, except upon two points, here fully discussed, follow certain defined precedents. An hour to each of the eleven chapters of this little book will make the teacher master of any legal difficulties that may arise, while ignorance of it puts him at the mercy of a rebellious pupil, an exacting parent, or a dishonest trustee.

2. *Hand-Book for Young Teachers.* By H. B. BUCKHAM, late principal of the State Normal School at Buffalo. Cloth, 16mo, pp. 152. Price 75 cts.

It anticipates all the difficulties likely to be encountered, and gives the beginner the counsel of an older friend.

3. *The School Room Guide*, embodying the instruction given by the author at Teachers' Institutes in New York and other States, and especially intended to assist Public School Teachers in the Practical Work of the School-Room. By E. V. DEGRAFF. Thirteenth edition, with many additions and corrections. 16mo, cloth, pp. 398. Price \$1.50.

As distinguished from others of the modern standards, this is a book of *Methods* instead of theories. It tells the teacher just what to do and how to do it; and it has proved more practically helpful in the school-room than any other book ever issued.

4. *A Quiz-Book on the Theory and Practice of Teaching.* By A. P. SOUTHWICK, author of the "Dime Question Books." 12mo, pp. 220. Price \$1.00.

This is one of the six books recommended by the State Department for study in preparation for State Certificates. The others are Hoose's *Methods* (\$1.00), Hughes's *Mistakes* (50 cts.), Fitch's *Lectures* (\$1.00), Page's *Theory and Practice* (\$1.25), and Swett's *Methods* (\$1.25). We will send the six post-paid for \$5.00.

5. *Mistakes in Teaching.* By JAMES L. HUGHES. American edition, with contents and index. Cloth, 16mo, pp. 135. Price 50 cts.

More than 15,000 have been used in the county institutes of Iowa, and elsewhere superintendents often choose this book for their less thoughtful teachers, assured that its pungent style and chatty treatment will arrest attention and produce good results.

6. *How to Secure and Retain Attention.* By JAMES L. HUGHES. 16mo, cloth, pp. 97. Price 50 cts.

This touches attractively and helpfully upon the first serious difficulty the teacher encounters. No young teacher should neglect these hints.

7. *Primary Helps.* A Kindergarten Manual for Public School Teachers. By W. N. HAILMANN. 8vo. boards, pp. 58, with 15 full-page plates. Price 75 cts.

In these days, no primary teacher can afford to be ignorant of "The New Education," and this is perhaps the only volume that makes kindergarten principles practically available in public schools.

8. *Dime Question Book, No. 4, Theory and Practice of Teaching.* 16mo, paper, pp. 40. Price 10 cts. By A. P. SOUTHWICK.

A capital preparation for examination.

C. W. BARDEEN, Publisher, Syracuse, N. Y.

Buckham's Handbook for Young Teachers.

This is emphatically a book for *beginners*, and it is a book without which no teacher should undertake a first term at school. The following commendations will show that it is a book the teacher cannot afford to do without.

I thank you for a copy of Mr. Buckham's book. I am willing to vouch for it without examination, knowing the author as I do. We shall doubtless want a number of copies for our classes.—Principal *E. A. Sheldon*, Oswego

It is a work of great value to the young and inexperienced teacher. It discusses the principles of the teacher's art in a manner which is at once simple and practical, without attempting to give a metaphysical discussion of them. I am sincerely glad Professor Buckham has undertaken this work, and I feel sure it will be appreciated by teachers throughout the country.—President *W. J. Milne*, New York State Normal College.

Admirably adapted to direct and help young teachers in organizing and managing a school. It is full of plain, pointed, and practical suggestions. * * * For the use I have spoken of I do not know of its equal.—Principal *F. B. Palmer*, Fredonia Normal.

I have read it and then read it again. It is timely, and just such a book as Prof. Buckham alone can write.—*A. B. Watkins*, assistant secretary Regents of the University.

I sent you an order for 40 copies of Buckham's *First Steps in Teaching*. They are received and are well liked. I am using them in my institute-work.—*Abbie Gifford*, Garner, Ia.

If there be another book to compare with in practical usefulness we have not seen it.—*Public School Journal*.

A model of condensation and hard sense, and a thoroughly trustworthy guide for the beginners in educational work.—*Iowa Normal Monthly*.

The author truly says that "teaching is a fine art, which, like other fine arts, so depends on a multitude of details that the neglect of any one of them spoils the effect of the whole, and robs even genius of half its power." In the spirit of this axiomatic truth the author deals with the important little things which every teacher should know in order to manage and teach properly. * * It is a valuable little manual, and will be especially helpful to beginners in the profession.—*N. E. Journal of Education*.

It will be of priceless value to many a teacher. May all catch the author's earnest spirit.—*N. Y. School Journal*.

This little book, written as it is in a free and friendly manner, will be the means of steering many a young teacher around unseen and dangerous snags.—*Deaf Mute Advocate*.

Its chapters of suggestions on specific points make this little manual a priceless *vade mecum* for all inexperienced teachers.—*No. Christian Advocate*.

It is simple, it is practical, it is suggestive, it is wonderfully minute in detail. In short, it anticipates all the difficulties likely to be encountered, and gives the beginner the counsel of an older friend.—*Utica Herald*.

Cloth, 16mo, pp. 152. Sent post-paid for 75 cts.

C. W. BARDEEN, Publisher, Syracuse, N. Y.

DeGraff's School-Room Guide.

The new edition of this well-known book is entirely re-written, introducing the methods in penmanship, drawing, etc., most approved at the present time. No other book ever published has helped so many teachers as this. There is not a county in America where its influence is not felt. Some books are recommended because it is creditable to own them; this is recommended by those who know it *because it will help*. Here are some testimonials.

I have known DeGraff's School-Room Guide for ten years, first as School Commissioner, where it was the book I recommended for my teachers, and recently as instructor of the Training Class in this city, where it is the text-book employed. * * *

I have no hesitation in saying that if a teacher can have but one book from which to obtain help in school work, that book should be DeGraff's School-Room Guide.—Principal G. A. Lewis, Syracuse, N. Y.

The almost unparalleled success of this volume, it having reached its 70th edition, is its all-sufficient recommendation. School-men and teachers in every county in the Union "know it like a book."—N. E. Journal of Education.

We do not know where else the earnest teacher can get so much of practical value within the same compass; hence if a teacher can have but one book to be a guide and an inspiration, *let this be the book*. It differs from the others in the fact that this is the volume sure to be consulted in a moment of perplexity, while others are read and then laid aside, perhaps forgotten * * * We like to commend a good book, and this is a good one; hence we want a thousand *Courant* readers to try it. We don't need to advise them to use it; they are sure to do that when once they have seen it.—*Educational Courant*.

A valuable book for all day-school teachers, as is shown by constant reprinting of it. Sunday-school teachers also may learn useful hints from its pages.—*Sunday School Journal*.

Cloth, 16mo, pp. 400, \$1.50 Sent postpaid on receipt of price.

Psychology made Practical.

The word "psychology" has been so much misused, and has been attached to so many catch-penny treatises written only to sell, that some educators avoid it altogether, as they would "nice" and "genial" and "genteel"—good words that have fallen into bad company. But all sound pedagogy is based upon psychology, and the following books may be recommended as scientifically sound, as well as unpretentious and attractive in manner.

1. *Apperception, or "A Pot of Green Feathers."* By T. G. ROOPER. Cloth, 16mo, pp. 52. Price 50 cts.

This work is published at the suggestion of W. T. Harris, LL.D., Commissioner of Education, who said of it at the recent Pedagogical Conference, at the Johns Hopkins University:

"The idea of 'apperception' is the most important fruit thus far developed by the study of the psychology of pedagogics. R. H. Quick, the eminent English authority refers in the highest terms to a short monograph on pedagogics which he had recently discovered, entitled *A Pot of Green Feathers*."

The book is a charming one, and simple enough to be understood by anybody.—*Nicholas Murray Butler, Ph.D.*, Professor of Philosophy, Columbia College, May 5, 1891.

I appreciate the book very highly, and am perfectly willing that you should use my name in connection with it, as I heartily recommend it to every teacher. My students have really enjoyed it very much. I think I shall always have my class buy copies of the book.—*Margaret K. Smith*, Oswego Normal School, June 10, 1891.

2. *The First Three Years of Childhood.* By B. PEREZ. With an introduction by Prof. JAMES SULLY. Cloth, 16mo, pp. 294. Price \$1.50.

3. *Tiedemann's Record of Infant Life.* An English version of the French Translation and Commentary by B. PEREZ. Paper, 16mo, pp. 46. 15 cts.

4. *Report on Pedagogical and Psychological Investigation.* By Wm. T. HARRIS, Commissioner of Education. Paper, 8vo, pp. 6. Price 15 cts.

5. *Child and Child Nature.* Contributions to the understanding of Froebel's Educational Theories. By the Baroness MARENHOLTZ-BUELOW. Cloth, 16mo, pp. 207. \$1.50.

6. *Development Helps.* By C. B. VAN WIE. Leatherette, 16mo, pp. 100. Price 50 cts.

7. *On Memory and the Rational Means of Improving it.* By Dr. EDWARD PICK. Cloth, 16mo, pp. 193. Price \$1.00.

8. *Sex in Mind and Education.* By H. MAUDSLEY. Paper, 16mo, pp. 42. Price 15 cts.

9. *The Art of Questioning.* By J. G. FITCH. Paper, 16mo, pp. 36. 15 cts.

10. *The Art of Securing Attention.* By J. G. FITCH. Paper, 16mo, pp. 43. Price 15 cts.

11. *How to Secure and Retain Attention.* By JAMES L. HUGHES. Cloth, 16mo, pp. 68. Price 50 cts.

12. *Unconscious Tuition.* By Bishop HUNTINGTON. Paper, 16mo, pp. 45. Price 15 cts.

C. W. BARDEEN, Publisher, Syracuse, N. Y.

Helps in Teaching Arithmetic.

1. *First Steps Among Figures*. A drill book in the Fundamental Rules of Arithmetic. By LEVI N. BEEBE. Cloth, 16mo, 3 editions. *Pupils' Edition*, pp. 140, 45 cts. *Oral Edition*, pp. 139, 50 cts. *Teachers' Edition*, including all in both the others, with additional parallel matter, Index, and Key, pp. 396, \$1.00.

These books give the only practical exposition of the *Grubé Method*, now so generally admitted to produce the best results with beginners. It has been used twelve years in the primary schools of such cities as Norwich, Conn., and Auburn, N. Y.; by vote of the board of education a copy of the Teachers' Edition was placed upon every primary teachers' desk in Syracuse; and for many years every student in the Albany State Normal School was directed to purchase a copy to take with him for his subsequent use in teaching.

2. *Intermediate Problems in Arithmetic for Junior Classes*; containing more than 4000 problems in Fractions, Reduction, and Decimals. By EMMA A. WELCH. Cloth, 16mo, pp. 172. Price 75 cts. Key to Part II, pp. 30, 50 cts.

In Syracuse and many other large schools, this takes the place of the small arithmetics in common use, forming with any larger or "practical" arithmetic a complete two-book series. The results obtained are in every instance far above those reached by the ordinary text-book. For city and graded schools no other collection of problems will compare with these in practical value and satisfactory results.

3. *The 30 Possible Problems in Percentage*, embracing a full and exhaustive discussion of the Theory of General Percentage, with 100 illustrative examples. By W. H. BRADFORD. Manilla, 16mo, pp. 84. Price 25 cts.

4. *Latitude and Longitude, and Longitude and Time*. Embracing a comprehensive discussion, with over 100 illustrative questions and examples. By J. A. BASSETT. Manilla, 16mo, pp. 42. Price 25 cts.

5. *Metric Tables and Problems*; a comprehensive drill in the Metric System, with 175 Problems and Answers. By OSCAR GRANGER. Manilla, 16mo, pp. 28. 25 cts.

6. *The International Date-Line, or Where does the Day Begin?* By HENRY COLLINS. Paper, 16mo, pp. 15. Price 15 cts.

7. *A Manual of Mensuration*, for use in Common Schools and Academies. By H. H. HUTTON. Boards, 16mo, pp. 150. Price 50 cts.

These five books treat exhaustively and with abundant illustration those features of arithmetic that are so often the occasion of difficulty. It is characteristic of good teaching to make the weak places strong, and these books will make pupils surest just where the average pupil is most uncertain.

8. *Number Lessons*, somewhat after the Grubé Method, giving on one side the combinations of the digits, and on the other an unlimited series of drill-exercises. Heavy card-board, 10x11 inches. Price 10 cts.

9. *The Regents' Questions in Arithmetic*, containing the 1298 questions given from 1886 to 1892. Manilla, 16mo, pp. 93, 25 cts. Key, pp. 20, 25 cts.

10. *Time Question Book, No 18, Arithmetic*. By ALBERT P. SOUTHWICK. Paper, 16mo, pp. 39. Price 10 cts.

C. W. BARDEEN, Publisher, Syracuse, N. Y.

Useful Appliances in Arithmetic.

1. *The Word Method in Number.* A series of 45 Cards, on which are printed all the possible Combinations of Two Figures. In box. By H. R. SANFORD, Institute Conductor. Size $3\frac{1}{4} \times 6$ inches. Price 50 cts.

These cards need only to be seen, as the principle is familiar and accepted. The type, in *written* figures, is large enough to be seen across the room, and the combination on one side is given in reversed order on the other, so that as the teacher holds the card before him he knows the figures presented to the class. The pupil is taught to look upon the combination 4 + 9 as *itself* 13, not as "4 and 9 are 13," just as he looks upon DOG as an entire word, not as D-O-G. Success is certain if new combinations are introduced only after those already given are thoroughly learned. Reviews should be constant.

2. *A Fractional Apparatus.* By W. W. DAVIS. A box of eight wooden balls, three and one-half inches in diameter, seven of which are sawn into 2, 3, 4, 6, 8, 9, and 12 parts respectively, while the eighth is left a sphere. Price \$4.00.

With this apparatus every principle and rule can be developed, and the pupils can be led to deduce rules for themselves.

Many other expedients are resorted to, but they are all objectionable. Suppose a teacher takes a stick and breaks it in the middle, will the pupil perceive two halves of a stick or two sticks? In teaching fractions objectively, that should be taken for unity from which if a part is taken unity is destroyed. This is not the case with a stick or cube. Apples are objectionable for three reasons; first because they cannot always be obtained; second because they are perishable; and third, because the attention of the pupils is diverted by a desire to know whether they are sweet or sour, etc. Nor can the teacher readily saw wooden balls into divisions even enough for the purpose designed, the charm of this method being the *exact* presentation to the pupil's eye of the fact illustrated.

3. *A Manual of Suggestions for Teaching Fractions* especially designed for accompanying the above apparatus. By W. W. DAVIS. Paper, 12mo, pp. 43. 25 cts.

This accompanying manual gives probably the best arrangement of the subject into sixty lessons ever made, with practical suggestions which all teachers will find valuable.

4. *Cube Root Blocks*, carried to Three Places. In box. \$1.00.

Our blocks are unusually large, the inner cube being two inches, and the additions each one-half inch wide.

5. *Numeral Frame*, with 100 balls, \$1.25; with 144 balls, \$1.50.

"Initiate children to arithmetic by means of the *ball frame alone*, thereby making their elementary instruction a simple and natural extension of their own daily observation," says Laurie, in his standard book on *Primary Instruction* (p. 112), and as he leaves the subject of arithmetic, he adds this note (p. 117), as if in fear he had not been sufficiently emphatic:

"The teaching of arithmetic should be begun earlier than is customary, and *always with the ball-frame.*"

C. W. BARDEEN, Publisher, Syracuse, N. Y.

Helps in Teaching Penmanship.

* 1. *Wells's Improved Practical Methods of Penmanship. Chautauqua Series. Copy Books*, Nos. 1, 2, 3, 4. Manilla, 7x8½, pp. 24, per dozen, \$1.20.

No. 1 presents a series of 24 oval exercises, combining in simple form all of the curve movements employed in writing—and may be used to advantage through two terms. It is designed to teach arm movement, pure and simple.

No. 2 contains a series of drills in large text hand, by means of which the straight line movement so essential to correct formation is thoroughly mastered; and introduces the standard capital letter movements systematically grouped and followed by drills on the letters themselves.

No. 3 is designed through a series of well arranged exercises to develop and apply the sliding or lateral movement in connection with the arm action. The movement acquired by this drill is the essential element in all business or current hand writing, giving both freedom and smoothness to the text. This number introduces the forms of all small letters and capitals, with a complete drill on the numerals.

No. 4 gives an attractive series of extended capital movement drills, together with useful combinations of the capital letters in connection with words. The special object of this number is to promote freedom and speed in execution; it also contains a review of all the letters.

In the Syracuse schools, where the method has been in use since 1879, numbers 1, 2 and 4 are each used two terms, and No. 3, four terms.

In a testimonial dated June 26, 1889, Sup't Blodgett and every one of the 20 principals of public schools in Syracuse unite in saying:

"This branch, which ten years ago was considered so difficult to handle and so generally barren of good results has become one of the most popular and helpful adjuncts of our school work.

"A fundamental principle of this system is in the substitution of the arm movements for those of the fingers for all purposes of writing, by means of which the youngest scholars may secure a freedom and strength in the character of their penmanship much in advance of anything hitherto shown.

"We take the term examination papers as the only true test of a scholar's advancement in penmanship, and as measured by this severe standard the results uniformly obtained are not only highly satisfactory, but are in many instances a revelation as to the possibilities in teaching business writing to children in the public schools.

"We are satisfied that this plan of teaching as introduced and carried on in our city schools here is entirely feasible, and that under like conditions equally good results may be obtained anywhere."

2. *A Lesson on Arm Movement in Writing*. By CHAS. R. WELLS. Paper, 8vo, pp. 23, illustrated, 25 cts.

This is an exposition of the principles and practice of the above system.

3. *Penmanship in Public Schools*. By J. L. BURRITT. 12mo, pp. 62, and chart. 60 cts.

4. *The Writing Portfolio*. By C. J. BROWN. Nos. 1-5, each 25 cts.

C. W. BARDEEN, Publisher, Syracuse, N. Y.

Helps in Teaching Natural Science.

1. *Laboratory Manual of Experimental Physics*. A brief course of Quantitative Physics, intended for Beginners. By ALBERT L. AREY. Cloth, 16mo, pp. 200. Price 75 cts.

This is a directly practical manual for elementary experimental work in physics. It gives full details for the construction of inexpensive apparatus, is abundantly illustrated, and gives on the right-hand pages blanks for entries by the pupil, usually in tabular form. The advantages of quantitative experiments are recognized, and this book is the first to make them possible in the ordinary high school. Immediately upon its appearance it was adopted for use in the Rochester Free Academy.

2. *Syllabus of Lectures on Physiology*. By THOS. B. STOWELL, Ph.D., principal of the State Normal School, Potsdam, N. Y. 3d edition. Boards, 8vo, pp. 133. Price \$1.00.

This is, like the above, a manual for practical work, with illustrations, and with the right-hand pages blank.

3. *A Hundred Home-Made Experiments in Natural Science*, by JOHN S. MCKAY, Ph.D. Paper, 16mo, pp. 50, price 15 cts.

This describes simple experiments so arranged as to teach physics inductively, and contains 17 illustrations. It may be used with profit in any district school.

4. *Systematic Plant Record*. By Prof. L. M. UNDERWOOD, Ph. D., of Syracuse University. Manilla, 4to, pp. 52. Price 30 cts.

The reputation of the author, who is eminent among the younger scientists of the country, is well sustained in this compendious and convenient record for the pupil's use.

5. *Dime Question Books of Physics, Chemistry, Geology, Botany, Zoology, Physiology, Astronomy*. By ALBERT P. SOUTHWICK. Paper, 16mo, pp. about 40. Price of each 10 cts.

Without being exhaustive in these subjects, these little books give much information and many useful suggestions to teachers. They are capital for review, and especially as preparations for examination.

6. *Dime Question Book of Stimulants and Narcotics*, prepared in accordance with the effort to promote Temperance in the Public Schools. By C. W. BARDEEN. Paper, 16mo, pp. 40. Price 10 cts.

It is invaluable to many others besides teachers. It quotes all the standard authors in its respective topics.—*Commonwealth, Boston*.

The few remarks about tobacco are, I think, truthful and just, neither too strong nor too mild. I could wish that our writers on alcohol would use a like moderation in their statements.—*A. Hazlewood, M.D., Grand Rapids, Mich., member of the State Board of Health, July 31, 1884.*

7. *How to Teach Natural Science in the Public Schools*. By W. T. HARRIS, LL.D., Commissioner of Education. Paper, 16mo, pp. 40. Price 15 cts.

Nothing better on the subject is accessible in so compact a form.—*The Critic, Aug. 27, 1887.*

C. W. BARDEEN, Publisher, Syracuse, N. Y.

Helps in Reading and Speaking.

1. *The Sentence Method of Teaching Reading.* By GEO. L. FARNHAM. Cloth, 16mo, pp. 50. Price 50 cts.

As the word method was a step above the alphabet method, so the sentence method is a step beyond the word method. "The unit of thought is the sentence," and if the child considers the words as units in learning to read, he must unlearn his habits of reading in order to read naturally. Mr. Farnham shows how much more easily children will learn to read, and how much better they will read, where this method is employed. The book is in general use all over the country—in Col. Parker's Cook County Normal School, among others. It is especially valuable for teacher's institutes.

2. *A Practical Delsarte Primer.* By MRS. ANNA RANDALL-DIEHL. 16mo, pp. 66, 50 cts.

This is a remarkable compact and forcible presentation of a system of elocution now so widely known and employed that no teacher of reading can afford to be ignorant of it. Mrs. Randall-Diehl is among the most eminent teachers in the land, and she has given here precisely the methods she herself employed. It contains a series of twelve charts which present the principles of the system so clearly that they cannot fail to be understood.

3. *A Manual of Elocution.* By JOHN SWETT. Cloth, 12mo, pp. 300. Price \$1.50.

4. *Memory Gems.* By GEO. H. HOSS. Paper, 16mo, pp. 40. Price 15 cts.

5. *Memory Selections.* By CHARLES NORTHEED. 24 manilla cards in a box. Three series, Primary, Intermediate, Advanced. Price of each, 25 cts.

6. *The Table is Set.* A Comedy for Schools, from the German by BENDIX. By WELLAND HENDRICK. 16mo, pp. 30. Price 15 cts.

Nothing is in greater demand than little plays for school entertainments, with few characters and requiring no scenery, and yet thoroughly bright and entertaining. This play will be found to meet all requirements.

7. *Calisthenics and Disciplinary Exercises.* By E. V. DEGRAFF. Manilla, 16mo, pp. 39. 25 cts.

8. *Home Exercise for Health and Cure.* With 45 Illustrations. Translated from the German of D. G. R. SCHREBER, by CHARLES RUSSELL BARDEEN. Cloth, 16mo, pp. 91, 50 cts.

A glance over the table of contents of this little book will show how widely it differs from the usual gymnastic exercises prepared for schools, in which the main object is to provide uniform and graceful movements that will look well in concert. Such movements are here given, as selected in the table on page 87, but the purpose of the book reaches far beyond them. It is especially a treatise for individual use,—a book to be kept on the dressing-table and followed every morning and evening, like a physician's prescription. Indeed, that is just what the book is, and in the original the combinations in Part III. are called "prescriptions" (Vorschriften).

In Germany 140,000 copies of the book had been sold up to 1889, and teachers are expected to be familiar with it, both for their own use and for that of their pupils. This translation, which purposely follows the original very closely, puts into the hands of American teachers the best treatise on bodily exercise now extant, and gives directions that will impart to many a strength and energy they had ceased to hope for.
